LAB REPORT

on

Object Oriented Java Programming (23CS3PCOOJ)

Submitted by

StudentName (**1BM23CS000**)

in partial fulfillment for the award of the degree of
BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING
(Autonomous Institution under VTU)
BENGALURU-560019
Sep-2024 to Jan-2025

B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “Object Oriented Java Programming (23CS3PCOOJ)” carried out by **StudentName (1BM23CS000)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Object Oriented Java Programming (23CS3PCOOJ) work prescribed for the said degree.

Lab faculty Incharge Name Assistant Professor Department of CSE, BMSCE	Dr. Jyothi S Nayak Professor & HOD Department of CSE, BMSCE

Program 1

Implement Quadratic Equation

Algorithm:

```
static void add() { System.out.println("Good Morning");}
```

OUTPUT:

Hello GoodMorning

30-9-2014
Q)

Develop a Java program that will all read solution to the quadratic equation $ax^2 + bx + c = 0$. Read in a, b, c and use the quadratic formula. If the discriminant $b^2 - 4ac$ is negative, display a message stating that there are no real solutions.

```
import java.lang.Math;
import java.util.Scanner;
class Quadratic
public static void main (String args[])
{
    double r1, r2, d;
    Scanner sc = new Scanner (System.in);
    System.out.println ("Enter coefficient of a");
    int a = sc.nextInt();
    System.out.println ("Enter coefficient of b");
    int b = sc.nextInt();
    System.out.println ("Enter coefficient of c");
    int c = sc.nextInt();
    if (a == 0)
```

NO SOLUTION

Date: / /

```

System.out.println("not a quadratic equation");
y
else {
    d = b*b - 4*a*c;
    if (d == 0.0) {
        r1 = (-d) / (2*a);
        System.out.println("Roots are real and equal");
        y
    } else if (d > 0.0) {
        r1 = ((-b) + (Math.sqrt(d))) / (2*a);
        r2 = ((-b) - (Math.sqrt(d))) / (2*a);
        System.out.println("Roots are real and distinct");
        y
    } else if (d < 0.0) {
        r1 = (-b) / (2*a);
        r2 = Math.sqrt(-d) / (2*a);
        System.out.println("Roots are imaginary");
        y
    }
}

```

1-10-2024 Lab Program - 2.

Implement a class Student in

Code:

```
import java.lang.Math;
import java.util.Scanner;
class Quadratic{
public static void main(String args[])
{
double r1,r2, d;
Scanner sc=new Scanner(System.in);
System.out.println("enter coefficient of a");
int a=sc.nextInt();
System.out.println("enter coefficient of b");
int b=sc.nextInt();
System.out.println("enter coefficient of c");
int c=sc.nextInt();
if(a==0.0){
System.out.println("not a quadratic equation");
}
else{
d=b*b-4*a*c;
if(d==0.0){
r1=(-d)/(2*a);
System.out.println("Roots are real and equal");
}
else if(d>0.0)
{
r1=((-b)+(Math.sqrt(d)))/(double)(2*a);
r2=((-b)-(Math.sqrt(d)))/(double)(2*a);
System.out.println("Roots are real and distinct");
}
else if(d<0.0)
{
r1=(-b)/(2*a);
r2=Math.sqrt(-d)/(2*a);
System.out.println("Roots are imaginary");
}
}
}
}
```

```

17-10-2021 Lab Program - 2.

Develop a Java program to create a class Student with members, usn, name, an array credits and an array marks. Include methods to accept and display details and a method to calculate SGPA of a student.

subject[i].grade = subject[i].subjectmarks / 10 + 1

SGPA = score / Grade

```
import java.util.Scanner;  
class subject {  
    int subjectmarks;  
    int credit;  
    int grade;  
    void calgrade()  
    { grade = (subjectmarks / 10) + 1;  
        if (grade == 11) {
```

```

call SuperClass
    {
        grade = grade - 1;
    }
    else if (grade < 4)
        grade = 0;
    }

class Student {
    string name;
    string um;
    double sgpa;
    double temp;
    int totalcredit;
    Subject subject[];
    Scanner s;
    Student() {
        int i;
        subject = new Subject[8];
        for (i = 0; i < 8; i++)
            subject[i] = new Subject();
        s = new Scanner(System.in);
    }
}

void getStudentDetails()
{
    System.out.println("Enter name and um of student");
    name = s.next();
    um = s.next();
}

void getMarks()
{
    System.out.println("Enter marks and credits of subject " + (i + 1));
    for (int i = 0; i < 8; i++)
    {
        System.out.println("Enter marks and credits of subject " + (i + 1));
    }
}

```

```

class Subject {
    SubjectName = s.next();
    credit[i] = credit - s.nextInt();
    subject[i] = (double) (grade / credit);
}

void calsgpa()

Program 4

Implement Area Equation

Algorithm:

Ques. Program No. 6

Create a package `ct` which has two classes `Student` and `Internate`. The class `Student` has members `int usn, name, sem`. The class `Internate` stored in five courses of the current semester the internal marks. Create another package `set` which has the class `Student` which uses the set marks stored in five courses of the current semester of the student. Improve the two packages in a file that contains the final marks of a student in all five courses.

package `ct`;

```
public class StudentMarks {  
    protected String usn;  
    protected String name;  
    protected int sem;
```

```
public StudentMarks (String usn, String name, int sem) {  
    this.usn = usn;  
    this.name = name;  
    this.sem = sem;
```

}

public void display StudentDetails ()

```
System.out.println ("USN: " + usn);
```

```
System.out.println ("Name: " + name);
```

```
System.out.println ("Semester: " + sem);
```

)

)

class Internate extends StudentMarks {

```
protected int[] internalMarks = new int [5];

21.10.2021 Lab Program no 4

- Develop a java program to create an abstract class named Shape that contains two integers and an empty method named printArea(). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contain only the method printArea() that prints the area of the given shape.

Steps

- 1 Add class InputScanner
- 2 Add class Shape extends InputScanner
- 3 Add class Rectangle extends Shape
- 4 Add class Triangle extends Shape
- 5 Add class Circle extends Shape
- 6 Add member invoking main method with objects and calling input method and printArea method.

Program:

```
import java.util.Scanner;
abstract class InputScanner {
    double x, y, result;
    void accept() {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the value of x:");
        x = sc.nextDouble();
        System.out.print("Enter the value of y:");
        y = sc.nextDouble();
    }
    abstract void calc();
}
```

is named
method
rectangle,
also extends
the method
area.

abstract class Shape extends InputScannable

void accept();

super.accept();

}

class Rectangle extends Shape {

void calc() {

result = x * y;

Program 5

Implement Bank Equation

Algorithm:

- LAB program no 5
- Develop a Java program to create a class Bank that maintains two kind of account for its customers, one called savings account and the other current account. The savings account provides compound interest and withdrawal facilities but no cheque book facility. The current account provides cheque book facility but no interest. Current account holder should also maintain a minimum balance and if the balance falls below this level, a service charge is imposed.
 - Create a class Account that stores customer name, account number and type of account. From this derive the class Sav-acc and Current-acc to make them more specific to their requirements. Include the necessary methods to achieve the following tasks:
 - Accept deposit from customer and update the balance.
 - Display the balance.
 - Compute and deposit interest.
 - Permit withdrawal and update the balance.
 - Check for the minimum balance, impose penalty if necessary and update the balance.

Class Account {

String customerName;

int accountNumber;

double balance;

String accountType;

public Account (String customerName, int accountNumber, String accountType) {

this.customerName = customerName;

this.accountNumber = accountNumber;

this.accountType = accountType;

this.balance = 0.0

}

Program 6:

Implement Package Equation

Algorithm:

Ques. Program No. 6

Create a package CT which has two classes Student and Internate. The class Student has members like usn, name, sem. The class Internate stored in five courses of the current semester the internal marks. Create another package SET which has the class Details which is the set marks stored in five courses of the current semester of the student. Improve the two packages in a file that contains the final marks of a student in all five courses.

package CT;

```
public class StudentMarks {  
    protected String usn;  
    protected String name;  
    protected int sem;
```

```
public StudentMarks (String usn, String name, int sem) {  
    this.usn = usn;  
    this.name = name;  
    this.sem = sem;
```

}

public void display StudentDetails ()

```
System.out.println ("USN: " + usn);
```

```
System.out.println ("Name: " + name);
```

```
System.out.println ("Semester: " + sem);
```

Y

Y

class Internate extends StudentMarks {

```
protected int[] internalMarks = new int [5];
```

```
public Internate (String usn, String name, int sem, int[])
```

Student :

Student Student {

marks :

{String usn, String
name, sem};
int[] marks = Internate

Write a program that demonstrates handling of exception in inheritance tree. Create a base class called "Father" and derived class called "Son" which extends the base class. In Father class, implement a constructor which takes the age and throws the exception WrongAge() when the input age < 0. In Son class, implement a constructor that takes both father and son's age and throws an exception if son's age is \geq father's age.

```
import java.util.Scanner;  
class WrongAge extends Exception  
{  
    public WrongAge()  
    {  
        System.out.println("Age Error");  
    }  
    public WrongAge(String message)  
    {  
        System.out.println(message);  
    }  
}  
class Father  
{  
    protected int fage;  
    public Father() throws WrongAge  
    {  
        Scanner scanner = new Scanner(System.in);  
        System.out.print("Enter Father's age: ");  
        fage = scanner.nextInt();  
        if (fage < 0)  
            throw new WrongAge("Father's age cannot be negative");  
    }  
    public void display()  
    {  
        System.out.println("Father's Age: " + fage);  
    }  
}
```

```

class Son extends Father {
    private int sonage;
    public Son () throws WrongAge
    {
        Scanner scanner = new Scanner (System.in);
        System.out.print ("Enter Son's age: ");
        sonage = scanner.nextInt ();
        if (sonage < age)
            throw new WrongAge ("Son's age cannot be greater than or
equal to Father's age");
        else if (sonage < 0)
            throw new WrongAge ("Son's age cannot be negative");
    }
    public void display ()
    {
        super.display ();
        System.out.println ("Son's Age: " + sonage);
    }
}

public class Demo
